Survey 0523H

Demersal Vessel Charter SIAMISS Survey

PROGRAMME

12 – 23 April 2023

Ports

Loading: Fraserburgh/Peterhead TBC 12 April 2023

Port Call: Scalloway TBC

Unloading: Fraserburgh/Peterhead (TBC), 23 April 2023

In setting the survey programme and specific objectives, etc. the Scientist-in-Charge needs to be aware of the restrictions on working hours and the need to build in adequate rest days and rest breaks as set out in Marine Scotland's Working Time Policy (Lab Notice 34/03).

In addition, the Scientist-in-Charge must formally review the risk assessments for the survey with staff on-board before work is commenced.

In the interest of efficient data management it is now mandatory to return the Survey Report to Iain Gibb within eight weeks of a survey ending and the Survey Summary Report (old ROSCOP form) to Matt Geldart within four weeks. In the case of the Survey Summary Report a nil return is required, if appropriate.

Estimated Days Per Project: 12 days, MONKRV (20702)

Fishing Gear: Anglerfish Trawl BT 195 (Supplied by Jackson Trawls)

Objectives

1. To undertake the Scottish Irish Anglerfish Megrim Industry Science Survey (SIAMISS). An internationally co-ordinated demersal trawling survey of Anglerfish (*Lophius piscatorius* and *Lophius budegassa*), Megrim (*Lepidorhombus wifflagonis*) and Four-Spot Megrim (*Lepidorhombus boscii*) at West of Scotland (ICES area VIa) and the North Sea (ICES area IVa).
2. To collect species distribution, length frequency and biological data of Anglerfish (*Lophius piscatorius* and *Lophius budegassa*), Megrim (*Lepidorhombus wifflagonis*), Four-Spot Megrim (*Lepidorhombus boscii*) Cod (*Gadus morhua*), Blue Skate (*Dipturus batis*) and Flapper Skate (*Dipturus intermedius*).
3. To collect additional species distribution, length frequency and biological data in connection with the UK Workplan and Data Collection Framework (DCF).

Procedures

General

The (Scottish Irish Anglerfish Megrim Industry Science Survey (SIAMISS) trawl survey follows a set of protocols drawn up by an industry science survey planning group made up of Marine Scotland & Marine Institute scientists and fishing industry representatives. These protocols share much in common with the sampling regimes described in the Marine Scotland SOPs for demersal trawl surveys and the Manual of the IBTS North Eastern Atlantic Surveys. Series of ICES Survey Protocols SISP 15. 92 pp. <http://doi.org/10.17895/ices.pub.3519>.

Loading of all trawl patching and equipment will take place on the 12th of April with rigging and testing being completed on the same day. The trawl will be supplied by Jackson Trawls already rigged to the ground gear. Loading of the scientific gear will take place on the same day. Charter vessel *Audacious* will sail as soon as possible on the 12th of April. Once safety drills have been completed, charter vessel *Audacious* will proceed NW into the Moray Firth where the first predefined station doubling as a shakedown trawl will be completed in order to check the net configuration, equipment functionality and the SCANMAR units. The route taken to complete the survey will be weather dependent and formulated close to survey departure. It is likely charter vessel *Audacious* will work North and West and complete the West Coast (Vla) survey area initially before a possible port call to land marketable fish in Scalloway. Following the port call, the remaining stations will be completed in the North sea before charter vessel *Audacious* makes for a NE (TBC) port for unloading. An operational daily survey plan will be formulated by the SIC subsequent to meetings with the charter vessel *Audacious*' Master.

Trawling

This is a semi-random-stratified survey design with trawl stations being distributed within 10 predefined strata that cover ICES areas IVa and VIa (See Figures 1.). Fishing operations will be conducted 18 hrs a day with scientific staff working throughout whilst ensuring adequate WTR rest breaks. A total of 34 primary stations and 59 alternative stations have been generated for the charter vessel *Audacious* (Tables 2 and 3 respectively).

The aim is for the 34 primary stations to be undertaken on suitable ground as near as to the specified station position, with the midpoint of the tow intersecting with the position. If not possible, then the tow will be conducted within a 5 nm radius. If this is not possible then the nearest suitable alternative station located within the same stratum will be used. Depending on survey progress, additional effort will be conducted in each strata utilising alternative stations to ensure maximum resolution in each of the survey strata where possible.

One trawl of 60 minutes duration will be made at each sampling station unless circumstances dictate. Trawling operations will occur in waters up to a maximum depth of 500m. The SCANMAR system will be used to monitor wing spread, door spread and distance covered during each haul. The charter vessel *Audacious*' echosounder will be utilised throughout the survey. Bottom contact data from each trawl will also be collected using the NOAA bottom contact sensor which will be mounted in the centre of the ground-gear.

Trawls will not be conducted where possible in highly-sensitive marine protected areas on the advice of JNCC and NatureScot. The nearest suitable alternative station in the same stratum shall be chosen if the trawl cannot be conducted within a 5nm buffer from the position outside the MPA.

Fish Sampling

Catches will be worked up according to the protocols for Marine Scotland Anglerfish surveys which are similar in principle to the protocols as described in the Manual of the IBTS North

Eastern Atlantic Surveys. Series of ICES Survey Protocols SISP 15. 92 pp. <http://doi.org/10.17895/ices.pub.3519>. The sampling methodology will follow the SIAMISS Fish Sampling V1.0 SOP. In addition to the routine sampling, biological data and samples will be collected for selected ad-hoc species if time allows.

The entire catch will be examined for species catch weight and length frequency when possible with biological data collected from the species detailed in table 1.

Post Survey

All scientific staff and equipment will be unloaded on 23rd April 2023.

Normal contacts will be maintained with the Laboratory.
